in the shop at once

3.2 min

typical stop in a section

When they came in

What to do about it

19:00 Your busiest hour

232 shoppers walked in during this hour alone. Put staff on the floor against this curve rather than against habit — the rush is usually later than it feels.

5.3 min Trials holds them longest

That is how long a shopper gives this one section before moving on. Keep your most knowledgeable staff near it.

8 hrs Kids had nobody serving

Shoppers stood in Kids with no staff nearby for that long, out of about 10.6 hours when anybody was in there at all. Assign it to one person by name rather than to whoever happens to be free.

Section by section

Section	Stopped	Share	Typical stop	Walked past
Casual	581	48%	3.5 min	226 times
Ethnic	544	45%	4.5 min	224 times
Trials	411	34%	5.3 min	0 times
Kids	318	26%	3.2 min	4 times
Billing	312	26%	2.5 min	12 times

Shoppers who stop at **Ethnic** spend 1 min 13 sec with stock actually in their hands, more than any other section.

Staff coverage

Section	Nobody serving	Longest gap	Wait for help
Kids	8.3 hours	105 min	1 min 07 sec
Casual	45 min	10 min	32 sec
Trials	45 min	25 min	35 sec
Ethnic	35 min	25 min	36 sec
Billing	15 min	15 min	29 sec

The wait counts only shoppers a staff member did reach. In **Kids**, 66% were never reached at all, so the wait shown for it is better than the experience was.

The counter was busiest at **18:00**, with 59 people through it that hour.

These figures are a demonstration, not measurements of your shop. They come from the pipeline running against a synthetic scaffold while the cameras are being installed. The structure, the wording and the arithmetic are real; the numbers are not. Nothing here should be acted on as a finding about your floor.

Counts come from anonymous video analysis. No faces are stored, no individual is identified, and nobody is recognised between visits.
